...

What is Threat Intelligence?

Threat intelligence involves analysing evidence-based information about cyber attacks, enabling cyber security experts to identify issues contextually and create targeted solutions for the detected problems.

Rooted in data, similar to open source intelligence (OSINT), threat intelligence provides context — like who is attacking you, what their motivation and capabilities are, and what indicators of compromise (IOCs) in your systems to look for — that helps you make informed decisions about your security.

— [Recorded Future](#)

It is important to note that within the topic of Cyber Threat Intelligence (CTI), there are several important subtopics to understand; Indicators of compromise and Advanced Persistent Threats and Traffic Light Protocol are three key areas to study in relation to CTI.

Indicators of Compromise (IOCs)

Indicators of compromise refer to data which can indicate that an organization may have been compromised by external actor. They are used by security teams to enrich logs in the SIEM so that, for example, if a new domain is marked as malicious by a threat intelligence provider, and activity is detected between an organization and the domain, the security team should be alerted and conduct an investigation.

Types of IOC data include:

- IP Addresses
- Domain names
- Malicious file names
- File Hashes
- URLs

Advanced Persistent Threats (APTs)

An advanced persistent threat (APT) is a sophisticated, sustained cyberattack in which an intruder establishes an undetected presence in a network in order to steal sensitive data over a prolonged period of time. An APT attack is carefully planned and designed to infiltrate a specific organization, evade existing security measures and fly under the radar.

— Crowdstrike

APTs are tracked in several ways by different organizations. MITRE tracks APTs using a numbering system, whereas Crowdstrike refers to them by a name, typically associated with the country of origin. For example, MITRE refers to Russia's General Staff Main Intelligence Directorate (GRU) as **APT28**, whereas Crowdstrike refers to them as **Fancy Bear**.

- Crowdstrike: <https://www.crowdstrike.com/adversaries/>
- MITRE: <https://attack.mitre.org/groups/>

Traffic Light Protocol

The Traffic Light Protocol (TLP) was created in order to facilitate greater sharing of information. TLP is a set of designations used to ensure that sensitive information is shared with the appropriate audience. It employs four colors to indicate expected sharing boundaries to be applied by the recipient(s)

— Cyber Security Infrastructure Security Agency

- **TLP: RED** — Not for disclosure, restricted to participants only.
- **TLP: Amber+Strict** — Limited disclosure, restricted to participants'

organization.

- **TLP: Amber** — Limited disclosure, restricted to participants' organization and its clients (see Terminology Definitions).
- **TLP: Green** — Limited disclosure, restricted to the community.
- **TLP: Clear** — Disclosure is not limited.

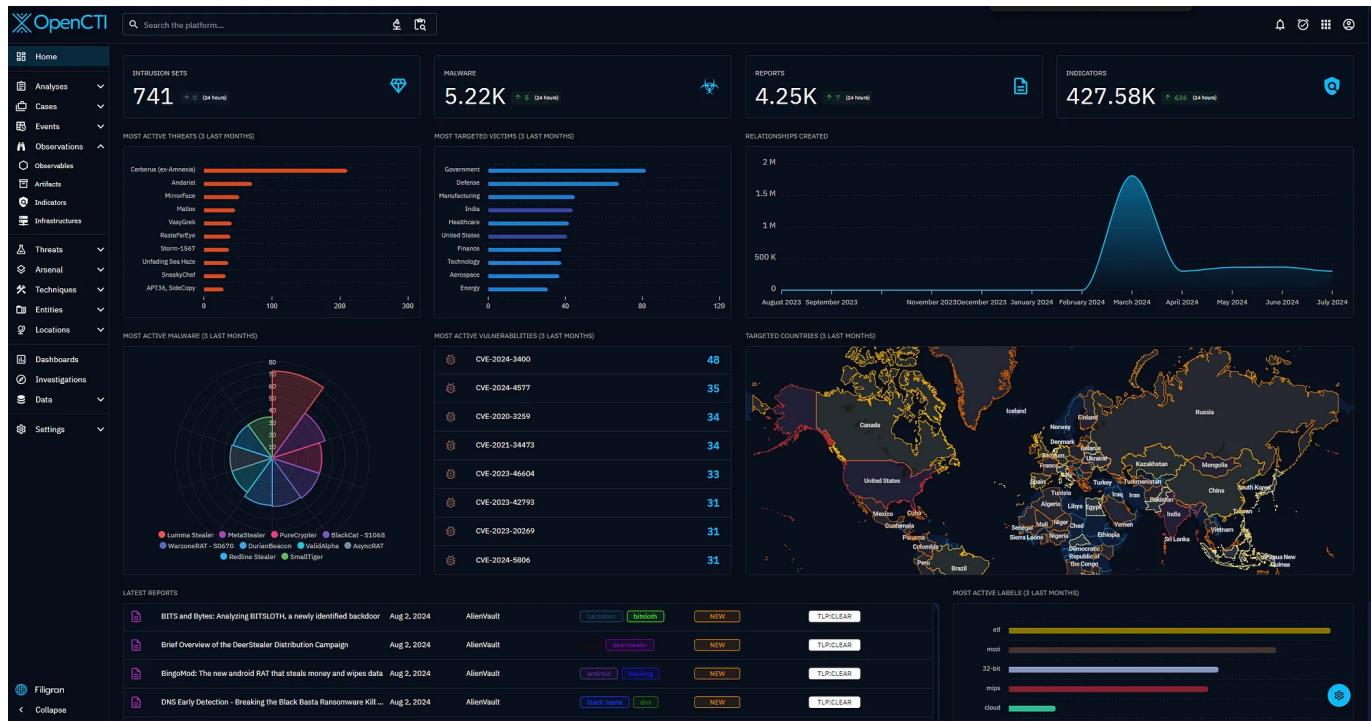

What is OpenCTI?

OpenCTI is an open source platform allowing organizations to manage their cyber threat intelligence knowledge and observables. It has been created in order to structure, store, organize and visualize technical and non-technical information about cyber threats.

The structuration of the data is performed using a knowledge schema based on the [STIX2 standards](#). It has been designed as a modern web application including a [GraphQL API](#) and an UX oriented frontend. Also, OpenCTI can be integrated with other tools and applications such as [MISP](#), [TheHive](#), [MITRE ATT&CK](#), etc.

— [OpenCTI](#)

OpenCTI is free to setup and run, consuming threat intelligence from open source and propriety threat feeds. It is ideal for using for a home lab on docker, although you can deploy to an organization (recommended to use Kubernetes). Once you start pulling data from threat feeds, you can very quickly get access to IOCs, threat reports, attack techniques, and more. The platform will automatically correlate similar threat intelligence so you can correlate multiple threat feeds to single entities.

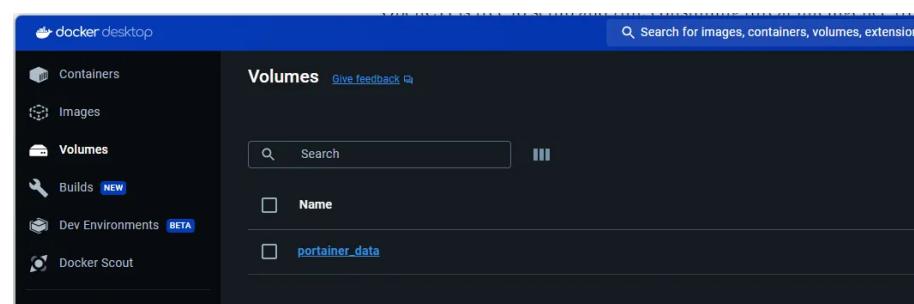

Setup and Install OpenCTI

For people who are less experienced installing and running docker, I suggest using [Docker Desktop](#), then installing Portainer. Portainer provides a web interface and makes it very easy to work with the docker daemon, which should make deploying OpenCTI much easier.

Install Portainer — [Full install guide here](#)

1. Create Docker volume

```
docker volume create portainer_data
```

2. Run Portainer

```
docker run -d -p 8000:8000 -p 9443:9443 --name portainer --restart=always -v /va
```

3. You will see the following once it has completed pulling the image.

```
var/run/docker.sock -v portainer_data:/data portainer/portainer-ce:latest
Unable to find image 'portainer/portainer-ce:latest' locally
latest: Pulling from portainer/portainer-ce
57654d40e0a5: Pull complete
1f476acfabd6: Pull complete
5171176db7f2: Pull complete

Status: Downloaded newer image for portainer/portainer-ce:latest
b43954094b08f33d258e3e78242f02b2c38d079be1f378baf2b7373655237796
```

4. The Portainer container is now running and available to connect

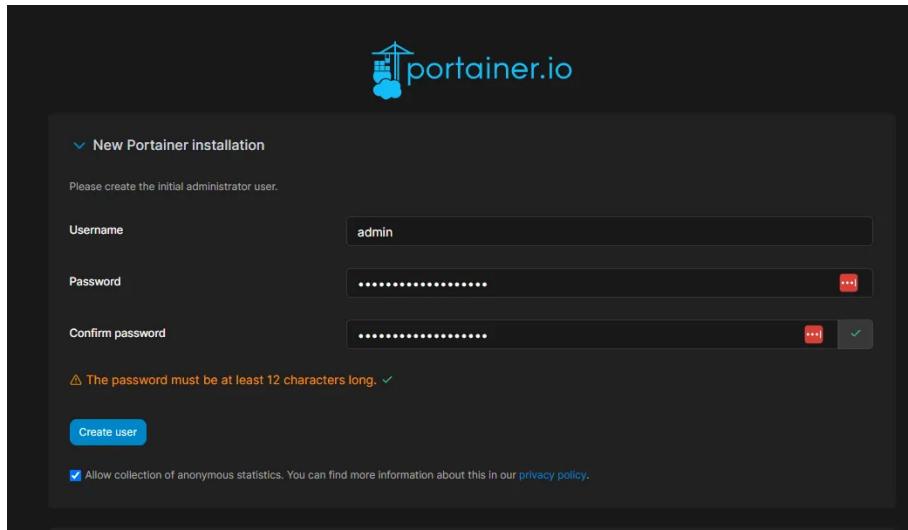

Name	Image	Status	CPU (%)	Port(s)
portainer b43954094b08	portainer/portainer-ce:latest	Running	0%	8000:8000 Show all ports (2)

Setup Portainer

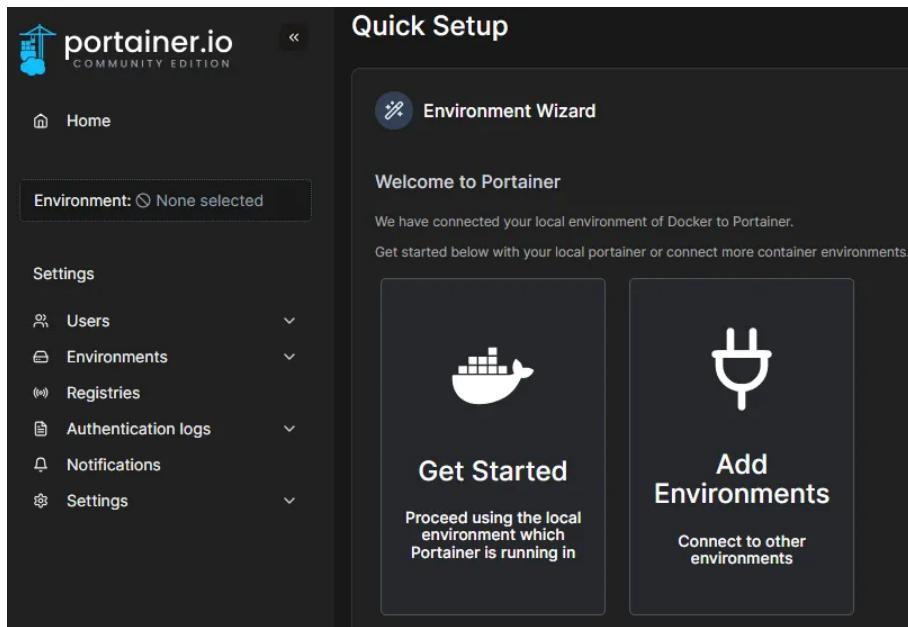

1. Connect to the new container using the following URL:

<https://localhost:9443>. Replace `localhost` with the relevant IP address or FQDN if needed, and adjust the port if you changed it earlier.

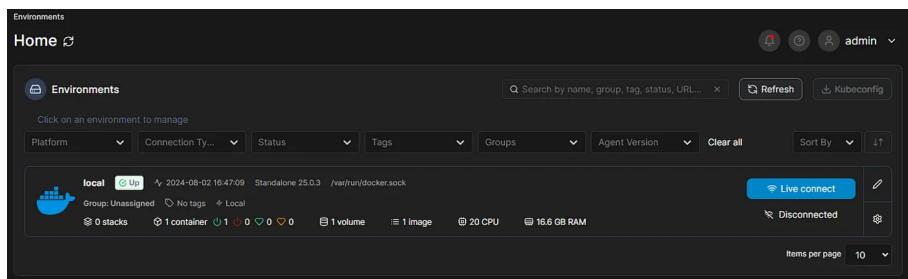

2. Create a password for the admin user.

3. Click Get Started.

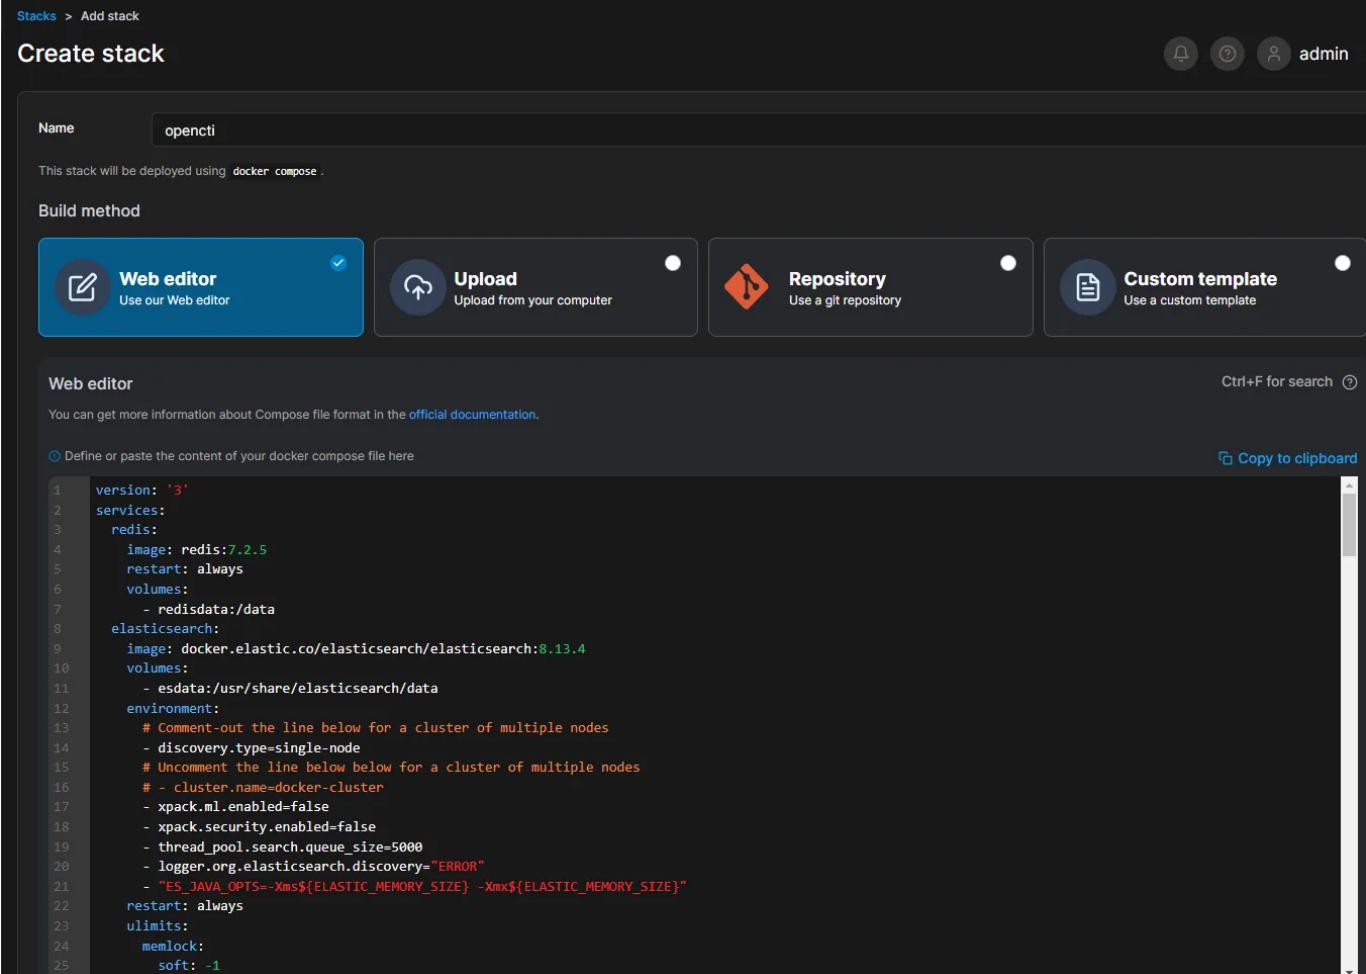

4. Click Live Connect

Take some time to explore the dashboard and familiarise yourself with the configuration.

Setup OpenCTI — Create Portainer Stack (Docker Compose)

1. Click On Stacks and create stack. Enter the name **opencti**

The screenshot shows the Portainer 'Create stack' interface. At the top, there's a navigation bar with 'Stacks > Add stack' and a user icon labeled 'admin'. Below the navigation is a 'Create stack' section. In the 'Name' field, 'opencti' is entered. Under 'Build method', the 'Web editor' option is selected, indicated by a blue background and a checked checkbox. The other options ('Upload', 'Repository', 'Custom template') have white backgrounds and unchecked checkboxes. The main area is a code editor titled 'Web editor' with a placeholder 'Define or paste the content of your docker compose file here'. The code content is a Docker Compose file:

```

version: '3'
services:
  redis:
    image: redis:7.2.5
    restart: always
    volumes:
      - redisdata:/data
  elasticsearch:
    image: docker.elastic.co/elasticsearch/elasticsearch:8.13.4
    volumes:
      - esdata:/usr/share/elasticsearch/data
    environment:
      # Comment-out the line below for a cluster of multiple nodes
      - discovery.type=single-node
      # Uncomment the line below for a cluster of multiple nodes
      # - cluster.name=docker-cluster
      - xpack.ml.enabled=false
      - xpack.security.enabled=false
      - thread_pool.search.queue_size=5000
      - logger.org.elasticsearch.discovery="ERROR"
      - "ES_JAVA_OPTS=-Xms${ELASTIC_MEMORY_SIZE} -Xmx${ELASTIC_MEMORY_SIZE}"
    restart: always
    ulimits:
      memlock:
        soft: -1

```

2. Below is an example docker compose file which can be used for the Stack.

Copy and paste to the Web Editor Window.

```

version: '3'
services:
  redis:
    image: redis:7.2.5
    restart: always
    volumes:
      - redisdata:/data
  elasticsearch:
    image: docker.elastic.co/elasticsearch/elasticsearch:8.13.4
    volumes:
      - esdata:/usr/share/elasticsearch/data
    environment:

```

```
# Comment-out the line below for a cluster of multiple nodes
- discovery.type=single-node
# Uncomment the line below below for a cluster of multiple nodes
# - cluster.name=docker-cluster
- xpack.ml.enabled=false
- xpack.security.enabled=false
- thread_pool.search.queue_size=5000
- logger.org.elasticsearch.discovery="ERROR"
- "ES_JAVA_OPTS=-Xms${ELASTIC_MEMORY_SIZE} -Xmx${ELASTIC_MEMORY_SIZE}"
restart: always

CONNECTOR_ANALYSIS_ID=4dff77c-ec11-4abe-bca7-fd997f79fa36
SMTP_HOSTNAME=localhost
ELASTIC_MEMORY_SIZE=4G
OPENCTI_URL=http://opencti:8080
```

4. Make sure to change the passwords in the environment variables file from **changeme** to something more secure. Click **Deploy Stack**. This will take some time as it will need to download additional docker images. Once complete you should see the stack deployed in the notification bell.

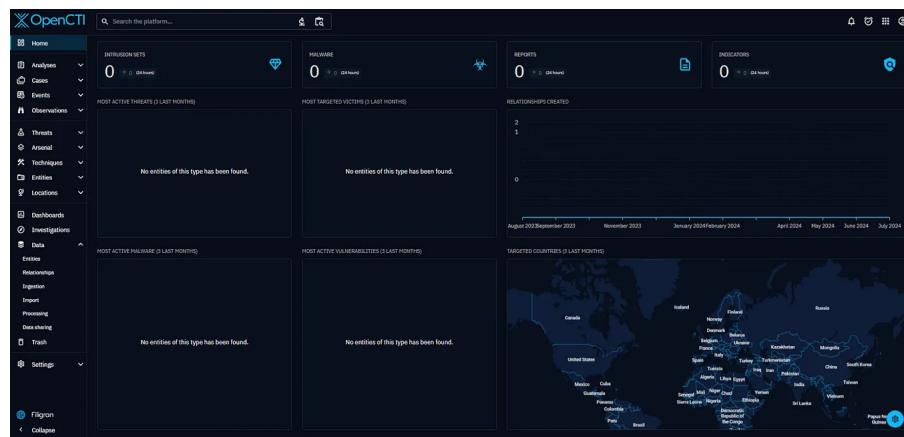

If you see any errors, you can examine the logs of each container and see if there are any connectivity issues.

Access & Start Using OpenCTI

1. Access the URL <http://localhost:8080/> using these credentials to login:

- Username: admin@opencti.io
- Password: You set this earlier in the environment variables

At this stage you won't see much happening as we haven't added any threat feeds just yet.

2. Lets add one threat feed from CISA, for known Exploited Vulnerabilities. This is referred to as "The KEV List".

Go back to the stacks editor. Paste the following code towards the bottom of the window. Ensure it is pasted above the **Volumes** section.

```
connector-cisa-known-exploited-vulnerabilities:
  image: openceti/connector-cisa-known-exploited-vulnerabilities:latest
  environment:
    - OPENCTI_URL=${OPENCTI_URL}
    - OPENCTI_TOKEN=${OPENCTI_ADMIN_TOKEN}
    - CONNECTOR_ID=dc788080-859b-49d7-8946-0ec346725204
    - CONNECTOR_TYPE=EXTERNAL_IMPORT
    - "CONNECTOR_NAME=CISA Known Exploited Vulnerabilities"
    - CONNECTOR_SCOPE=cisa
    - CONNECTOR_CONFIDENCE_LEVEL=100 # From 0 (Unknown) to 100 (Fully trusted)
    - CONNECTOR_UPDATE_EXISTING_DATA=false
    - CONNECTOR_RUN_AND_TERMINATE=false
    - CONNECTOR_LOG_LEVEL=info
    - CISA_CATALOG_URL=https://www.cisa.gov/sites/default/files/feeds/known_ex
    - CISA_CREATE_INFRASTRUCTURES=false
    - CISA_TLP=TLP:CLEAR
    - CISA_INTERVAL=2 # In days, must be strictly greater than 1
  restart: always
```

3. It should look like this. (Note, indentation on Docker Compose is important, so it may indicate that there is a formatting error. Ensure it is correctly indented).

4. You will need to generate a Connector ID for any new connectors you add.
In my example, the ID is on Line 191.

This is required for every subsequent connector; you can generate new IDs using the following site [UUID Generator](#).

5. Click Update stack; it will download the new container image and run. To confirm this, navigate to Arsenal, and then Vulnerabilities.

The screenshot shows the OpenCTI platform interface. On the left is a sidebar with various navigation options: Home, Analyses, Cases, Events, Observations, Threats, Arsenal (which is expanded), Malware, Channels, Tools, Vulnerabilities (which is selected and highlighted in blue), Techniques, Entities, and Locations. The main content area is titled 'Arsenal / Vulnerabilities'. It features a search bar at the top with placeholder text 'Search the platform...' and a dropdown menu labeled 'Arsenal / Vulnerabilities'. Below the search bar is another search bar specifically for results with placeholder 'Search these results...', a 'Add filter' button, and a clear icon. The main table lists ten vulnerability entries:

	NAME	CVSS3 - SEVERITY	LABELS	ORIGINAL CREATION DATE	MODIFICATION DATE	CREATORS
<input type="checkbox"/>	CVE-2006-1547	-	No label	Jan 21, 2022	Aug 2, 2024	admin
<input type="checkbox"/>	CVE-2010-1871	-	No label	Dec 10, 2021	Aug 2, 2024	admin
<input type="checkbox"/>	CVE-2010-5326	-	No label	Nov 3, 2021	Aug 2, 2024	admin
<input type="checkbox"/>	CVE-2012-0158	-	No label	Nov 3, 2021	Aug 2, 2024	admin
<input type="checkbox"/>	CVE-2012-0391	-	No label	Jan 21, 2022	Aug 2, 2024	admin
<input type="checkbox"/>	CVE-2012-3152	-	No label	Nov 3, 2021	Aug 2, 2024	admin
<input type="checkbox"/>	CVE-2013-3900	-	No label	Jan 10, 2022	Aug 2, 2024	admin
<input type="checkbox"/>	CVE-2014-1776	-	No label	Jan 28, 2022	Aug 2, 2024	admin

6. If you click on one of the vulnerabilities you will see the detail which has been downloaded.

7. For troubleshooting, you can click on **Data**, then **Ingestion**. Click on **Connectors** to see the newly added **CISA Known Exploited Vulnerabilities** connector. You can see the Worker statistics pane is showing there is activity ongoing.

OpenCTI Connectors

You can add multiple connectors, to pull threat feeds from external sources. The full list of available connectors can be found here on the [OpenCTI GitHub](#)

Some of these connectors require an API token; whilst some are free to use, please ensure you read the Terms and conditions for the appropriate usage. For individuals, some threat intel services such as AlienVault OTX will allow the consumption of their threat intel for free, but for organizations, it requires a paid subscription. There is a ReadMe for each connector, but for reference, the AlienVault OTX link can be found [here](#)

I've added my configuration to my [GitHub](#), which you are free to download and use for yourself, but bear in mind that you will need to generate the required API tokens.

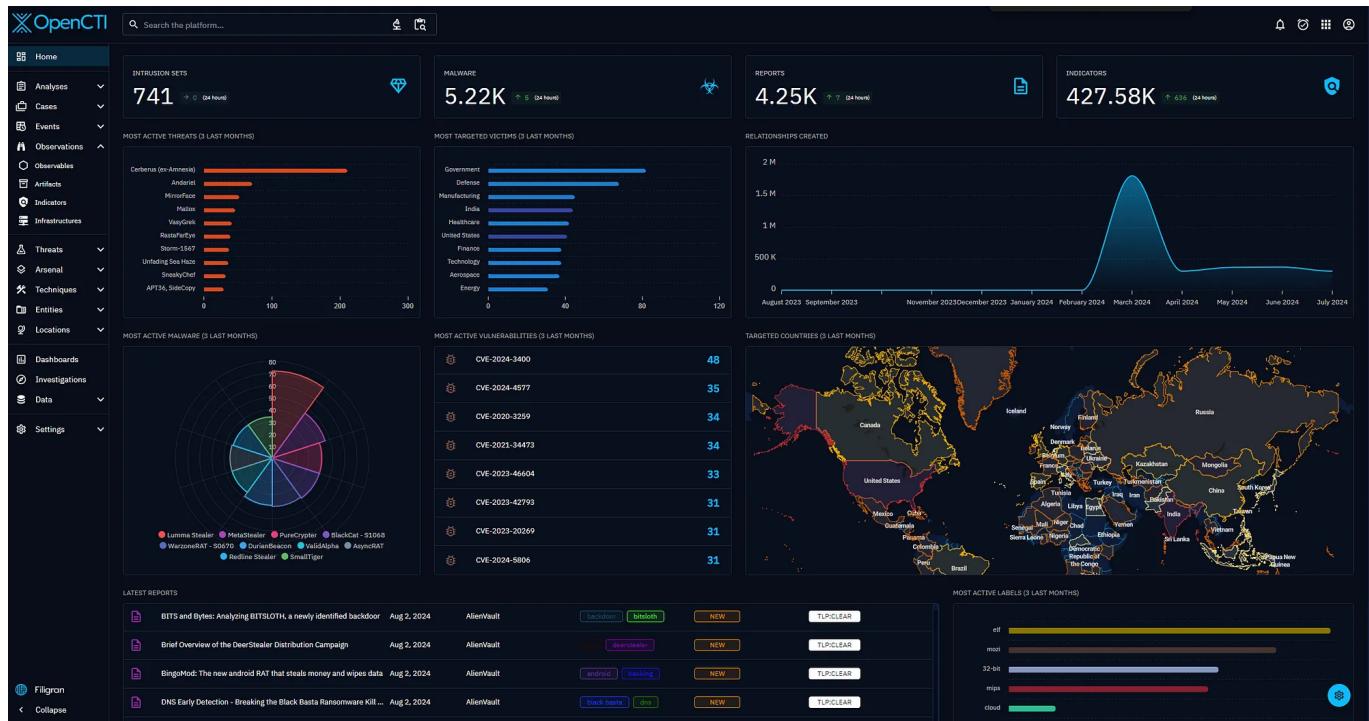

Some of the Connectors I use for my home lab include:

- Shodan
- AlienVault OTX
- Abuse IPDB
- URL Haus

Once you've added multiple connectors, confirm the data is being ingested by checking the Connectors page again. The data will be queued and can take up to 24 hours to download and process.

#	NAME	TYPE	AUTOMATIC TRIGGER	MESSAGES	MODIFIED	Actions
1	APT & Cybercriminals Campaign Collection	Data import	NOT APPL...	0	Aug 2, 2024, 6:46:54 PM	Edit Delete
2	Abuse.ch SSL Blacklist	Data import	NOT APPL...	0	Aug 2, 2024, 6:47:21 PM	Edit Delete
3	Abuse.ch URLhaus	Data import	NOT APPL...	0	Aug 2, 2024, 6:47:14 PM	Edit Delete

Once its finished syncing, it should populate the dashboard like below.

OpenCTI — Indicators Of Compromise

Navigate to the Indicators and Observables pages to see the various IOCs which have been downloaded. These are searchable in the platform and can help you find out who may be behind an attack.

The screenshot shows the 'Observations / Indicators' page. The sidebar includes links for Home, Analyses, Cases, Events, Observations, Artifacts, Indicators, Infrastructures, Threats, Arsenal, Techniques, Entities, Locations, and a 'Filigran' button.

The main content area displays a table of attack patterns:

PATTERN TYPE	NAME	AUTHOR	CREATORS	LABELS	ORIGINAL CREATION DATE	VALID UNTIL	MARKING
stix	45.116.13.178	AlienVault	admin	[backdoor] [espionage]	Aug 2, 2024, 11:18:36 ...	Aug 22, 2024	TLP:CLEAR
stix	216.238.121.132	AlienVault	admin	[backdoor] [espionage]	Aug 2, 2024, 11:18:36 ...	Aug 22, 2024	TLP:CLEAR

OpenCTI — Attack Patterns

For any aspiring Red Teamers or Pen testers, check out the Attack Patterns for guidance on how adversaries may attempt to breach different systems, for example; OS credential dumping in Linux.

Final Thoughts

OpenCTI is a great way to learn more about threat intelligence and is a fun project which you can learn at home, but you could always deploy within an Organization. OpenCTI integrates nicely with [MISP](#), which is another popular source of open source threat intel.

Proprietary threat intel feeds from organisations such as Recorded Future and ReliaQuest can be very expensive; so a great way to augment your systems is to use aggregators like MISP and OpenCTI (Or build your own!). This can furnish your SIEM and SOAR products with threat intel to compliment the restricted information which you may pay for.
